

# MULTI-USER MANAGEMENT

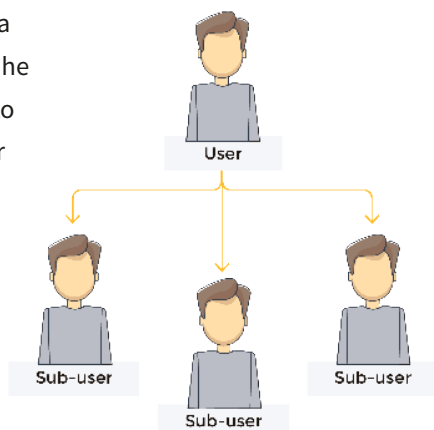

The main user can create several subusers who can be given different permissions for each of their controllers.

For example, in the following diagram, we can see that “Sub-user 1” will be able to view, edit and configure all the controllers, while “Sub-user 2” will only be able to view two of the three controllers, and edit one of them, and “Sub-user 3” will only have consultation permissions on the three controllers.

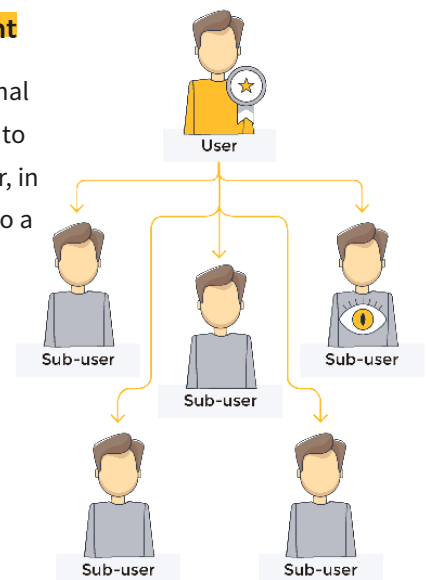

## Basic account

If the user has a basic account, he can create up to 3 sub-users per controller.

## Professional account

If the user has a professional account, he can create up to 10 sub-users per controller, in addition to giving access to a master.

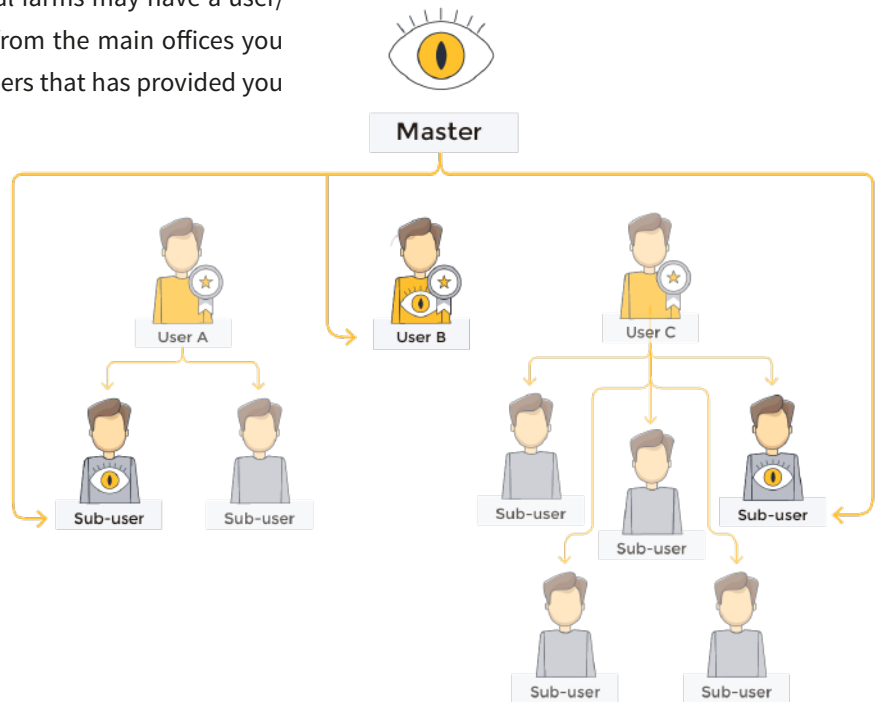

## Management by master

The master is designed for managers of large farms or agro-industries.

For example, a company that manages several farms may have a user/manager on each of them. With the master, from the main offices you will be able to see the status of all the controllers that has provided you with the permits.

In order to become a master, please contact us to be confirmed.

We will give a key (code) to the master, which you will have to provide to the users/managers of whom you want to have access to your equipment. Users will have to enter the password in the “Master Permissions” section of the user and sub-user management section. Once introduced, the master will already have access.
